

Neptune m100ST

Coriolis Mass Flowmeter

Flow Rate 5.0 to 500 kg/min (11 to 1100 lb/min)

Direct Mass, Density and Temperature Measurement • No Moving Parts Patented Omega Flowtubes • Smooth-bore, Non-obtrusive Flow Path Wide 100:1 Turndown • Lowest Pressure Drop

The Neptune m100ST delivers outstanding mass flowmeter performance and accuracy in a compact package, providing continuous direct measurement of mass, density, temperature, and percent solids over the flow range of 5.0 to 500 kg/min (11 to 1100 lbs/min).

Patented dual omega-shaped tubes provide outstanding sensitivity to Coriolis forces. Mass flow accuracy is +/- 0.10% with the NexGen SFT200 mass flow transmitters. The mass flow repeatability is +/- 0.10% and the density accuracy is +/- 0.001 g/cc over its operating range.

The transducer is more sensitive to Coriolis forces than conventional mass flowmeters, providing a greater mechanical gain. Fluid velocity requirements are much lower to produce a given signal. This results in a lower pressure drop and unequaled 100:1 turndown. Accuracy never has to be compromised to obtain an acceptable pressure drop.

The smooth-bore, non-obtrusive flow path is free from moving parts, seals, and bellows. The omega shape reduces stress on the tubes for improved durability.

Pressure Drop Versus Flow Rate

Determining Pressure Drop

- 1. Flow rate vs. pressure drop varies with viscosity. To approximate m100ST pressure drop for fluids with viscosity approximating that of water, locate the point on the 1-cP curve corresponding with your desired flow rate.
- 2. From that point, locate the nearest horizontal line and follow it to the vertical scale on the left, which indicates pressure drop for the flow rate you selected.
- 3. Divide the pressure drop indicated on the graph by the specific gravity (S) of the process fluid: $\Delta P_{\text{actual}} = \Delta P_{\text{plotted}} / \text{Sp. Gr.}$

Calculating Actual Accuracy

Use the following formula to calculate $\ \mathring{\mathbf{m}}^{\ }$ accuracy for your selected flow rate:

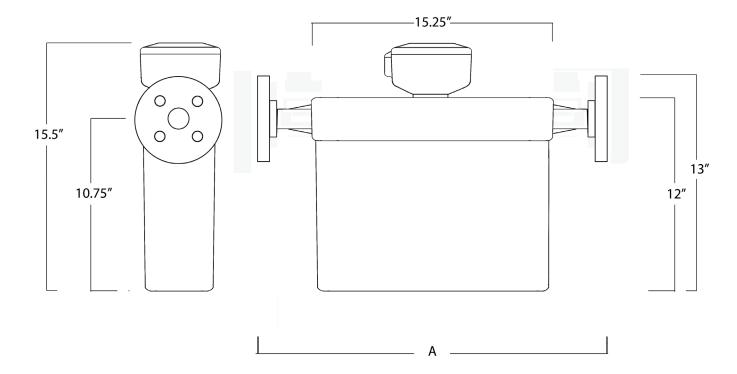

% accuracy, $B1_{actual} = \{ [(0.0010 \text{ m}) + S_0] / \text{m} \} \times 100\%$

where:

m = mass flow rate, kg/min or lb/min S_0 = mass zero stability, kg/min or lb/min for the m100 flowmeter
